LEAD / STAFF .NET ENGINEER

12 Years Full Stack .NET • 7 Years Fully Remote • Central Time

Staff-level .NET engineer who owns platform architecture end to end, from system design through the deployment pipeline it ships on. Twelve years full stack .NET and seven fully remote, most recently the first lead-level engineering hire at Storee, a 200-person firm, where I set the architecture, built the team, and consolidated four applications onto a single .NET 9 platform on Azure without interrupting production releases. I design and evolve systems for long-term scalability and performance in secure, regulated environments. The standards I establish in code review, testing, and release discipline improve code quality and accelerate delivery.

CORE COMPETENCIES

Technical Leadership: Software Architecture & System Design, Platform Consolidation, Migration Strategy, Team Building & Mentoring, Cross-Functional Collaboration

Languages & Frameworks: C#, .NET 10 / .NET 9 / .NET Core, ASP.NET / Web API, Razor Pages, REST APIs, TypeScript, React, JavaScript

Cloud & DevOps: Azure, Azure DevOps, Azure Bicep, Azure Container Registry, Azure Container Instances, Docker (multi-stage builds), Cloudflare, CI/CD Pipelines, Infrastructure as Code, Monitoring & Telemetry

Database & Performance: SQL Server, Entity Framework / EF Core, Database Architecture, Performance Optimization, Query Optimization

Architecture Patterns: SOLID Principles, Clean Architecture, Dependency Injection, API Design

Security & Compliance: Auth0, SSO / MFA, Security Standards, Financial Services Compliance

Development Practices: Agile / Scrum, Git / Branching Strategy, Code Reviews, Unit Testing, AI-Assisted Development

PROFESSIONAL EXPERIENCE

STOREE CONSTRUCTION - Remote (Springfield, MO)

Commercial construction firm focused on project management and field operations

Lead / Staff .NET Engineer, Remote

June 2024 to Present

- Set technical direction for the entire application estate of a 200-person construction firm as its first lead-level engineering hire, choosing the target architecture, the migration strategy, and the delivery standards the team still works to, then consolidated four ASP.NET applications into a unified .NET 9 platform on Azure
- Directed cross-functional delivery across internal teams, third-party IT partners, contractors, QA, and executive stakeholders, maintaining consistent production releases on a high-risk legacy platform by removing blockers, reprioritizing work, and providing clear technical direction to prevent release delays
- Improved data architecture and system reliability by transitioning from stored procedure-driven access to Entity Framework and implementing database integrity controls, reducing data inconsistencies and improving development velocity
- Reduced release cycle time by 50% through code reviews, testing workflows, release controls, and technical documentation, establishing a repeatable, auditable delivery process for high-accountability environments
- Built the React and TypeScript front end on the consolidated platform, replacing the separate interfaces the four legacy applications carried, and defined the Azure infrastructure in Bicep so environments were provisioned from source rather than through a portal
- Executed a phased Strangler Fig migration strategy to incrementally replace legacy components while maintaining uninterrupted production releases and minimizing business risk, aligning the platform with Clean ("Onion") architecture
- Hired and mentored a four-person engineering team by conducting technical interviews, onboarding new engineers, and providing guidance on architecture, code quality, and collaboration to ensure confident project delivery
- Recorded architecture decisions in writing so disagreements resolved through a documented tradeoff rather than through seniority, giving a four-person team a standard to build against rather than a person to ask

CONWAY INVESTMENT RESEARCH - Remote (St. Louis, MO)
Investment research and advisory firm supporting financial advisors

Lead Full Stack Developer, Remote

July 2019 to June 2024

- Sustained 200+ software releases across a live financial platform by designing and operating CI/CD pipelines that maintained high deployment reliability and minimized risk to production financial systems
- Sole engineer for the last three of five years on the client-facing platform serving 200+ advisors, clients and staff, owning architecture, infrastructure, release and production support across the full stack
- Cut \$30,000+ from Azure and third-party spend through infrastructure optimization and vendor coordination, improving efficiency without reducing platform availability
- Implemented SSO using Auth0 with MFA/2FA enforcement across client-facing applications, streamlining client onboarding and strengthening authentication security in compliance with modern access control standards
- Modernized platform from .NET Framework to .NET 6 and upgraded frontend to TypeScript, establishing the architectural foundation for all future development, ensuring alignment with Microsoft's latest best practices, and eliminating exposure to framework deprecations
- Architected and delivered financial modeling tools used directly by investment advisors to analyze fund performance, compare investment vehicles, and forecast client outcomes, representing the firm's core analytical value proposition

CASS INFORMATION SYSTEMS - St. Louis, MO
Financial services company specializing in payment processing

Senior Full Stack Developer, Hybrid

Nov 2018 to July 2019

- Built and enhanced .NET and SQL Server payment applications processing thousands of transactions a day
- Optimized slow-running SQL queries and application performance through indexing and query refactoring

HUNTER ENGINEERING - St. Louis, MO
Manufacturer that engineers automotive service equipment

Senior Full Stack Developer, On-Site

May 2015 to Nov 2018

- Maintained business-critical applications for thousands of employees and customers, and built automated reporting tools in Excel, PDF, and web dashboards to improve business visibility
- Mentored junior developers and provided technical guidance across development teams

STATE OF MISSOURI - Jefferson City, MO
Department of Social Services

Full Stack Developer, Hybrid

Jan 2014 to May 2015

- Developed and maintained full-stack .NET and SQL Server applications for public assistance and child welfare systems used by thousands of state staff and citizens, resolving production issues to keep them stable

PROJECT SHOWCASE

THE YARD - theyard.stevenstout.biz | github.com/SteveStout/TheYard
A production platform on Azure, designed, built, deployed and operated solo

.NET 10 • React • TypeScript • Bicep • Docker • CI/CD

2026 to present

- Built a React and TypeScript front end over a .NET 10 API with parameter-driven search and detail views, covered by unit, component and end-to-end suites running in CI on every push
- Hand-authored a multi-stage Dockerfile, published the image to Azure Container Registry, and ran it on Azure Container Instances with the whole environment defined in Azure Bicep rather than clicked in a portal
- Hosted the platform on a custom domain with HTTPS terminated at a Cloudflare edge in front of the container, so the public address survives any re-host behind it and the certificate renews without intervention
- Published the architecture decisions as ADRs served from inside the app itself, alongside the resume, so the reasoning is readable without a walkthrough
- Owned the data model, the search and indexing strategy, and the rule that serializes simultaneous bids, and used Claude Code for implementation against tests I specified

EDUCATION

University of Missouri - Bachelor of Science in Information Technology
Minor in Computer Science
Internships: Payless ShoeSource, Central Technology Services
